

Zeolite

Zeolite is a 100% natural mineral-derived soil stimulant.

Soil depends on beneficial microbes. These microbes digest organic matter in the soil and make critical nutrients available to plants. They also defend plants from disease-causing organisms by competing with them for space and nutrients.

In soil, surface area and porosity are key factors, both for the growth and maintenance of populations of beneficial and in terms of nutrient and water flow.

Zeolite:

- Is a 100% natural mined product.
- Adds porous material to the soil, which increases its nutrient- and water-holding capacity.
- Increases the available surface area within the soil, providing a place for beneficial microbes to grow.
- Helps regulate the flow of water and nutrients.
- Increases the effectiveness of other fertilizers.
- Aids in erosion control.

DIRECTIONS FOR USE:

Apply 1 pound every linear foot.

To Control Water: Cut trenches 8" deep with an airknife, then apply a 2" deep layer at bottom of trench. Leave trench open for 24 hours or cover with tar paper or weed cloth.
